Central nervous system - Wikipedia This differentiates the central nervous system from the peripheral nervous system, which consists of neurons, axons and Schwann cells. Oligodendrocytes and Schwann cells have similar functions in the central and peripheral nervous system respectively. Central nervous system (CNS) | MS Trust The nervous system is divided into two areas: Central nervous system (CNS) This consists of the brain and spinal cord and is enclosed within the skull and spine. Peripheral nervous system (PNS) All other nerves. These connect the central nervous system to the rest of the body. Central Nervous System - National Library of Medicine ... The central nervous system (CNS) includes the nerves in the brain and spinal cord. It is safely contained within the skull and vertebral canal of the spine. All of the other nerves in the body are part of the peripheral nervous system (PNS).

Central nervous system: Structure, function, and diseases The central nervous system consists of the brain and spinal cord. It is referred to as "central" because it combines information from the entire body and coordinates activity across the whole. What does the central nervous system do? What does the central nervous system do? Your spinal cord receives information from the skin, joints and muscles of your body. It also carries the nerves that control. Nervous System: Facts, Function & Diseases - Live Science The human body has a central nervous system and a peripheral nervous system. These systems have specific functions, and can be affected by a variety of diseases.

Central Nervous System - Brain and Spinal Cord The central nervous system (CNS) is the processing center for the nervous system. It receives information from and sends information to the peripheral nervous system. The two main organs of the CNS are the brain and spinal cord. The brain processes and interprets sensory information sent from the spinal cord.
